An AI-Powered Social Deduction Game

- AI Imposter Plus One is a browser-based multiplayer social deduction game.
- The game supports 2–6 human players with an optional AI player.
- Players receive secret, related words and give clues without revealing their words.
- The AI receives its own secret word and participates as a normal player.
- The AI can generate clues, analyze player clues and cast a vote.
- Players can interact using text or voice-based clues.

Problem Statement

Traditional imposter games mainly depend on human players and manual interaction.

EXISITING CHALLENGES

- Requires multiple human players for an engaging game.
- No intelligent player that can participate independently.
- Clue generation and deduction are completely human-driven.
- Limited AI-based analysis of player clues.
- Voice interaction is not commonly integrated into simple browser-based games.

OBJECTIVE

To develop a web-based imposter game where an AI player can participate, generate clues, analyze player responses and vote along with human players.

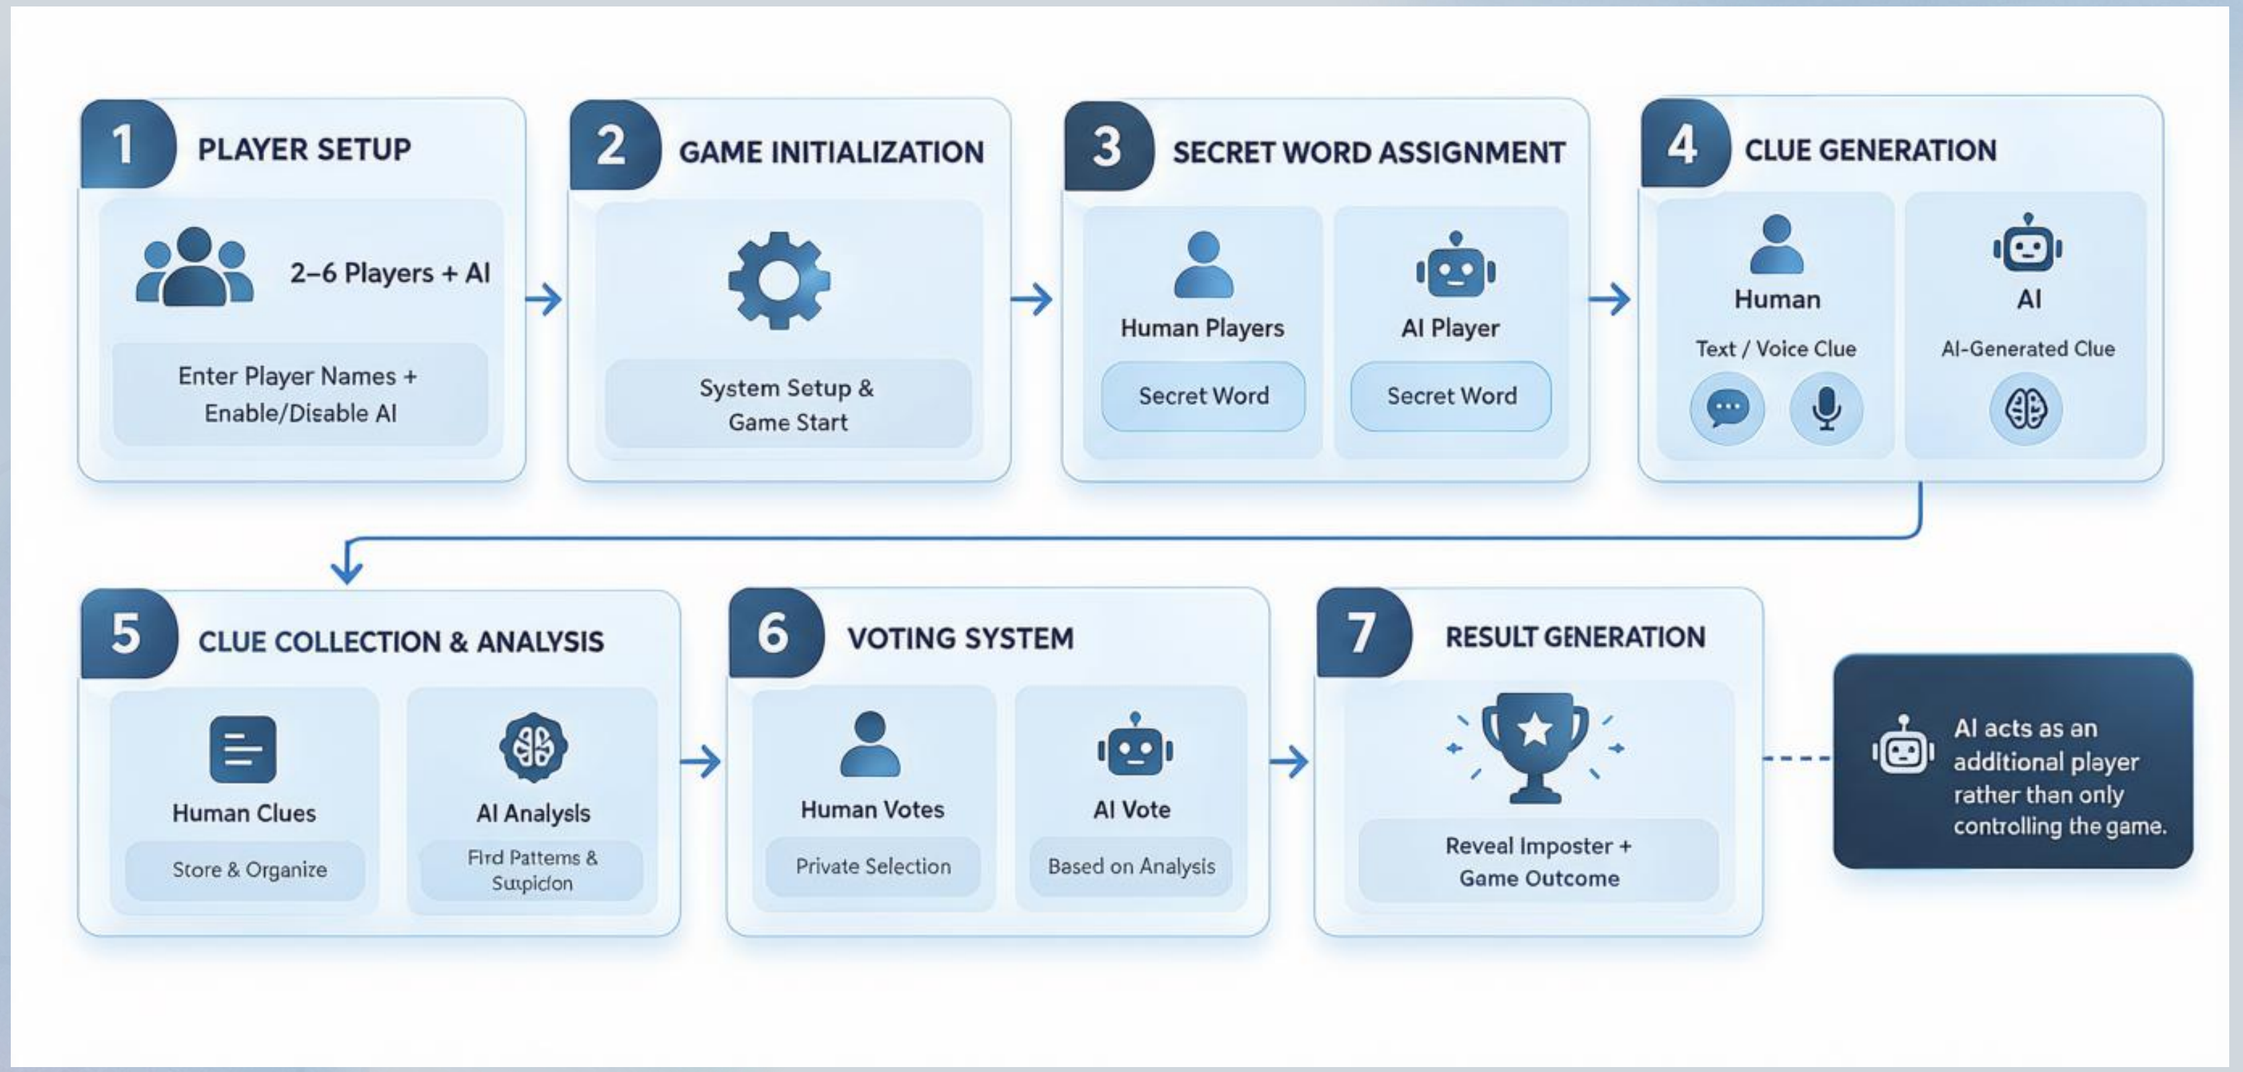

Exisiting System

- Mainly human players
- Manual clue generation
- Human-only observation
- Manual voting
- Mostly text/manual interaction
- No autonomous AI participant
- Fixed game interaction

Proposed System

- Human players + optional AI
- AI can generate clues
- AI analyzes player clues
- AI also participates in voting
- Text + voice interaction
- AI acts as an additional player
- Automated game flow

SYSTEM ARCHITECTURE

SOFTWARE & HARDWARE TOOLS

01 Software

- Visual Studio Code – Development environment
- HTML – Web page structure
- CSS – UI design and animations
- JavaScript – Game logic and interaction
- Web Speech API – Voice input / speech recognition
- AI / LLM API – AI clue generation and analysis
- Web Browser – Running the application
- Git / GitHub – Version control

02 Hardware

- Laptop / Desktop
- Keyboard & Mouse
- Microphone – for voice mode
- Internet Connection – for AI API communication

CONCLUSION

- AI Imposter Plus One combines Artificial Intelligence with multiplayer social deduction gameplay.
- The AI participates as an actual player rather than simply managing the game.
- It can generate clues, analyze player responses and participate in voting.
- Text and voice interaction provide different ways for players to participate.
- The project demonstrates a practical application of AI, natural language interaction and intelligent decision-making

Future Scope

- Advanced AI reasoning
- Multiple AI difficulty levels
- Improved voice interaction
- Player behavior analysis
- Online multiplayer support

Thank You

for your time
and attention
